EDUCATION

2021 - 2025 UNIVERSITY OF EMBU

• Bsc. Computer Science

SKILLS

- Languages: JavaScript, TypeScript
- Frameworks: React, TailwindCSS, Next js, Redux
- State management: Redux Toolkit, Context API
- APIs: RESTful APIs, Axios
- Tools: Git, GitHub, VS Code

PROFILE

I build responsive and user-friendly interfaces that meet real user expectations, following a "design for failure" approach to ensure reliability and resilience. I translate UI designs into pixel-perfect interfaces, ensuring high visual accuracy and consistency. I leverage TypeScript to catch bugs early in development, resulting in cleaner, safer, and more maintainable code.

PROJECTS

- Pregnant Mother Monitoring System JAN 2025
 Stack: React, TailwindCSS, TypeScript, Flask, MongoDB
 - A full-stack web application designed to empower pregnant women to monitor their own health and that of their unborn babies by tracking vital health metrics. The system interprets this data in real-time, provides clear insights, and advises the mother to seek medical attention if any warning signs are detected - potentially helping reduce maternal risk by up to 60% in underserved areas.

Key Features

- Health Tracking: Allows mothers to record and monitor weight, blood pressure, symptoms, and more.
- Automated Health Insights: Interprets input data and presents it in a simple, visual way to help mothers understand their status.
- Smart Risk Alerts: Warns the mother if any metric indicates potential danger and recommends medical attention.
- Chat with doctors: Optional communication channel for mothers to ask questions or consult a healthcare provider.
- Secure Signup: Separates registration for mothers and doctors, with role-based dashboards.
